

Maximum Demand Controller

- ◆ Advance Microcontroller based
- ◆ Wide working voltage between R phase - N, 150v to 240v
- ◆ Default display KVA/MVA
- ◆ Display of phase Ampere and Voltage of individual phase is on selection.
- ◆ Current sensing through up to 5000A/ 5A ct
- ◆ CT ratio selection 5A, up to 995 and 50A in KA range 1.00KA
- ◆ Auto range selection 99.9 kva to 999 kva to MVA range
- ◆ 125% over load capacity
- ◆ Resolution 0.1 KVA

Display Mode Selection : For selection the display press and hold the button `UP` the short-form of related parameters and their current value scrolls on display window. Releasing the button at desire parameter would be selected to display. The explanation of display short-forms are given below

r_U	r_U : R phase voltage
y_U	Y_U : Y phase voltage
b_U	b_U : B phase voltage
r_A	r_A : R phase ampere
y_A	Y_A : Y phase ampere
b_A	b_A : B phase ampere
+UA	KUA : display KVA/MVA

- Note:
1. KVA/MVA is in default selected mode, any other selected parameter to display will be held on display until any power failure/reset occurred
 2. If any trip moment occurred, the display window will lead to display current KVA/MVA and blinks frequently at regular interval.

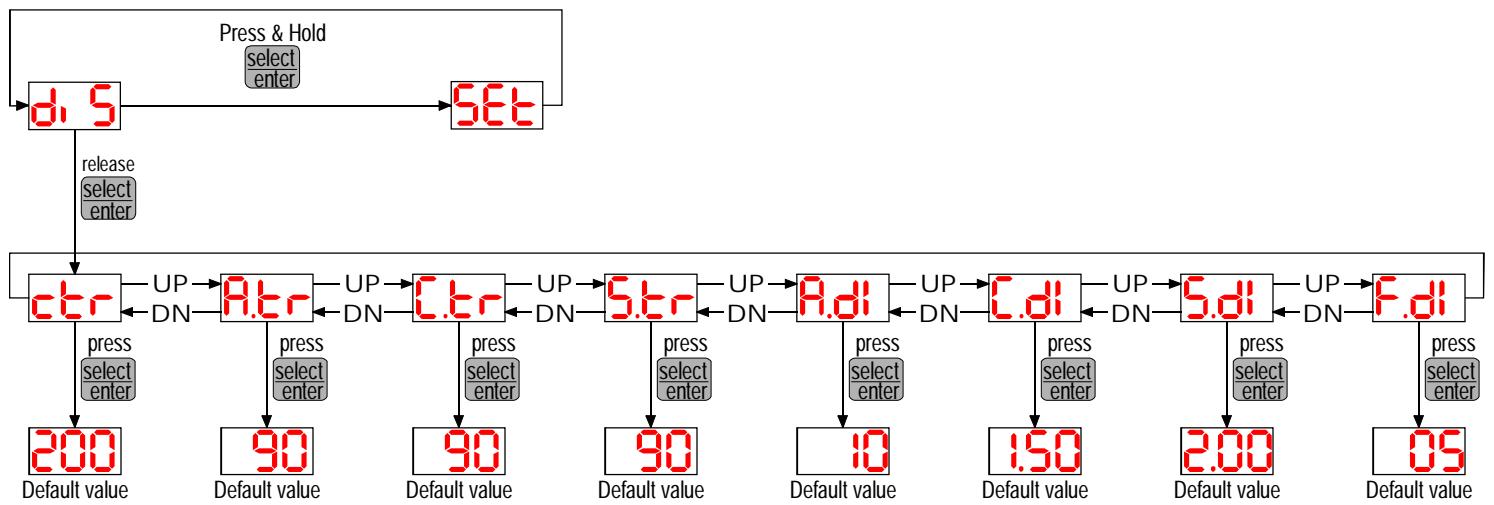

Maximum Demand Controller

Display The Set Variables :

Set Variable Parameters are

- | | |
|---|------|
| 1. CT Ratio ----- | ctr |
| 2. Alarm Trip KVA/MVA ----- | A.tr |
| 3. Contactor Trip KVA/MVA ----- | C.tr |
| 4. Second Contactor Trip KVA/MVA ----- | S.tr |
| 5. Alarm Delay (range-1 second to 30 second) ----- | A.dl |
| 6. Contactor Delay (range- 0.5 minut to 15 minutes) ----- | C.dl |
| 7. Second Contactor Delay (range- 0.5 minut to 15 minutes) – S.dl | S.dl |
| 8. Off Delay /Reset Delay (range- 1 second to 30 second) ----- F.dl | F.dl |

Press and hold `SELECT/ENTER` key, `diS` and `SET` will display on screen alternatively, release the button as `diS` comes on screen, the controller will enter to display the set variable parameters, press and hold `UP or DN` key to change the variables on screen. To select to display the related variable value, press `SELECT/ENTER` key, as selected variable comes on screen and, related value displays on screen for two seconds.

Maximum Demand Controller

Setting The Variables :

Press and hold `SELECT/ENTER` key, `diS` and `SET` will display on screen alternatively, release the button as `SET` comes on screen, the controller will enter to set parameters mode and screen displays `P.00`, that is page 00. Press and hold `UP or DN` key to change the page on screen.

To select to set the related variable value, press `SELECT/ENTER` key, as related page comes on screen, the parameter and their last saved value displays on screen and blinks for next action. Page no and related variables are as given below :

P.00	---	Not in use
P.02	---	Alarm Trip KVA/MVA
P.04	---	Second Contactor Trip KVA/MVA
P.06	---	Contactor Delay
P.08	---	Off Delay/Reset Delay

P.01	---	CT Ratio
P.03	---	Contactor Trip KVA/MVA
P.05	---	Alarm Delay
P.07	---	Second Contactor Delay
